

Warmup:

Factor each of the following expressions:

$$\underline{1x^2} + 9x + 8 = (x+8)(x+1) \quad \underline{1x^2} - 8x - 20 \quad (x-10)(x+2)$$

Warmup:
Factor each of the following
expressions:

$$\underline{12x^2} + \underline{11x} + 2 = (3x+2)(4x+1) \quad \left\{ \quad \underline{10x^2} - \underline{19x} + 6 \right.$$

$$12x^2 + 8x + 3x + 2$$

$$4x(3x+2) + 1(3x+2)$$

$$10x^2 - 15x - 4x + 6$$

$$5x(2x-3) - 2(2x-3)$$

$$(2x-3)(5x-2)$$

Warmup:

Factor each of the following

expressions:

perfect squares

$$t^2 - 20t + 100$$

$$\begin{array}{ccc} & 100 & \\ -10 & \times & -10 \\ & -20 & \end{array}$$

$$2(10t) = 20t$$

$$(t-10)(t-10)$$

$$(t-10)^2$$

difference of squares

$$49x^2 - 36$$

$$\begin{array}{cc} \downarrow & \downarrow \\ 7x & 6 \end{array}$$

$$(7x+6)(7x-6)$$

$$\begin{array}{ccc} & 1764 & \\ 42 & \times & -42 \\ & 0 & \end{array}$$

sum of squares

$$n^2 + 25$$

$$\begin{array}{cc} \downarrow & \downarrow \\ n & 5 \end{array}$$

$$(n+5i)(n-5i)$$

E.Q.:

How do we solve a quadratic equation using factoring?

What are the **roots**, or x-intercepts, or **zeroes**, or **solutions** to a quadratic equation?

ZERO★ PRODUCT★ PROPERTY

-The zero product property is used when solving equations that involve multiple factors.

-The zero product property states:

$$\textit{If } a \cdot b = 0, \textit{ then } a = 0 \textit{ or } b = 0$$

-When an equation is in factored form, applying the zero product property says:

- 1) Set every factor equal to zero.
- 2) Solve each equation.

Examples:

$$1) \underline{(2x)}(\underline{x+4}) = 0$$

$$\frac{2x}{2} = \frac{0}{2} \quad \text{or} \quad \begin{array}{c} x+4=0 \\ -4 \quad -4 \end{array}$$

$$x = 0$$

or

$$x = -4$$

$$2) (x-6)(x+9) = 0$$

$$x-6=0$$

$$x+9=0$$

$$x = 6$$

$$x = -9$$

$$3) (2x - 5)(x - 3) = 0$$

$$2x - 5 = 0 \quad x - 3 = 0$$

$$\begin{array}{l} +5 \quad +5 \\ 2x = 5 \\ \frac{2x}{2} = \frac{5}{2} \end{array}$$

$$x = 3$$

$$x = \frac{5}{2}$$

$$\underline{\underline{x = 2,5}}$$

$$4) (x)(3x - 12)(2x + 1) = 0$$

$$x = 0$$

$$3x - 12 = 0$$

$$2x + 1 = 0$$

$$\frac{3x}{3} = \frac{12}{3}$$

$$2x = -1$$

$$x = 4$$

$$x = -\frac{1}{2}$$

SOLVING EQUATIONS BY FACTORING

-We can use our methods of factoring and the zero product property to solve equations.

-In order to solve by factoring:

1) ALWAYS set the equation equal to zero

Make sure the term with x^2 is positive

2) Factor the equation using the appropriate method.

Remember to always check for a GCF first

3) Use factored form to apply the zero product property

Examples:

$$x^2 - 7x - 120 = 0$$

$$\begin{array}{c} -120 \\ -15 \quad +8 \\ -7 \end{array}$$

$$(x - 15)(x + 8) = 0$$

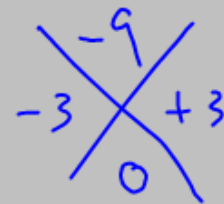

$$x - 15 = 0$$

$$x = 15$$

$$x + 8 = 0$$

$$x = -8$$

$$x^2 - 9 = 0$$

$$\begin{array}{c} -9 \\ -3 \quad +3 \\ 0 \end{array}$$

$$(x+3)(x-3) = 0$$

$$x+3=0$$

$$x-3=0$$

$$x = -3$$

$$x = +3$$

$$x = \pm 3$$

$$\underline{8}x^2 - 6x - 5 = 0$$

~~$$\begin{array}{cc}
 & -40 \\
 -10 & & +4 \\
 & -6 &
 \end{array}$$~~

$$8x^2 - 10x + 4x - 5$$

$$2x(4x-5) + 1(4x-5)$$

$$(2x+1)(4x-5) = 0$$

$$2x+1=0 \quad 4x-5=0$$

$$x = -\frac{1}{2} \quad x = \frac{5}{4}$$

$$x^2 + 36 = 0$$

$$\underline{x^2 - 36}$$

$$(x + 6i)(x - 6i) = 0$$

$$x + 6i = 0 \quad x - 6i = 0$$

$$x = -6i \text{ or } 6i$$

$$x^2 + 2x + 1 = 0$$
