E.Q.:

How do we solve quadratic equations using the quadratic formula?

SHORTCUT To Completing The Square?

The Quadratic Formula

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This formula works for all **standard form** quadratic equations.

It is directly derived by completing the square on the standard form of a quadratic equation:

$$ax^2 + bx + c = 0$$

We have studied several different ways to solve quadratic equations (factoring and taking square roots). These methods may not work in certain instances. The **Quadratic Formula** is a method of solving quadratics that **works for every quadratic equation.**

- -In order to set up quadratic formula, we need our quadratic equation written in standard form:

$$ax^2 + bx + c = 0$$

- -Once the quadratic is in standard form, we plug **the coefficients** a, b, and c into the quadratic formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Solve using the quadratic formula:

$$x^2 + 6x + 5 = 0$$

$$\frac{-b \pm \sqrt{b^2 - 4ac}}{(2a)}$$

$a = 1$
$b = 6$
$c = 5$

$$x = \frac{-6 \pm \sqrt{(6)^2 - 4(1)(5)}}{2(1)}$$

$$x = \frac{-6 \pm \sqrt{16}}{2}$$

$$x = \frac{-6 \pm 4}{2}$$

$$x = \frac{-6+4}{2} = \frac{-2}{2} = -1$$

$$x = \frac{-6-4}{2} = \frac{-10}{2} = -5$$

EXAMPLES Set up the quadratic formula for each of the following quadratic equations.

$6x^2 - 45 = 3x$

$-3x \quad -3x$

$6x^2 - 3x - 45 = 0$

$a = 6$

$b = -3$

$c = -45$

$$x = \frac{3 \pm \sqrt{(-3)^2 - 4(6)(-45)}}{2(6)}$$

$$x = \frac{3 \pm \sqrt{1089}}{12}$$

$$x = \frac{3 \pm 33}{12}$$

$$x = \frac{3+33}{12} = \frac{36}{12} = 3$$

$$x = \frac{3-33}{12} = \frac{-30}{12} = -\frac{5}{2}$$

$4x^2 = -9 - 9x$

$+9 \quad +9x$

$4x^2 + 9x + 9 = 0$

$a = 4$

$b = 9$

$c = 9$

$$\frac{-9 \pm \sqrt{(9)^2 - 4(4)(9)}}{2(4)}$$

$$\frac{-9 \pm \sqrt{-63}}{8}$$

$$x = \frac{-6 \pm \sqrt{12}}{2}$$

$$x = \frac{-6 \pm 2\sqrt{3}}{2}$$

$$x = \frac{-6 + 2\sqrt{3}}{2} \quad \text{or} \quad \frac{-6 - 2\sqrt{3}}{2}$$

$$x = \sqrt{3} - 3 \quad \text{or} \quad -\sqrt{3} - 3$$

$$-3 \pm \sqrt{3}$$

$5x^2 = 80$

$5x^2 - 80 = 0$

$$x = \frac{\pm \sqrt{1600}}{10}$$

$$x = \frac{\pm 40}{10}$$

$x = -4$ or $+4$
