Operations with Polynomials

Gum Drop!

monomial

$$(10x^2 - 9x + 6)$$

Not Like terms

Objectives

Identify, evaluate, add, and subtract polynomials.

A **monomial** is a number or a product of numbers and variables with whole number exponents.

$$7x^7 \quad -4x^5$$

A **polynomial** is a monomial or a sum or difference of monomials. Each monomial in a polynomial is a term. Because a monomial has only one term, it is the simplest type of polynomial.

$$\begin{array}{ccc}
 10x^2 - 9x + 6 & \left\{ \begin{array}{l} x - 4 \\ \text{binomials} \end{array} \right\} & \left\{ \begin{array}{l} 3x^2 \\ \text{monomial} \end{array} \right\} \\
 \text{trinomial} & &
 \end{array}$$

Polynomials have no variables in denominators or exponents, no roots or absolute values of variables, and all variables have whole number exponents.

$$\frac{4}{3x}$$

Polynomials: $\underline{3x^4}$ / $\underline{2z^{12} + 9z^3}$ / $\underline{-\frac{1}{2} \cdot a^7}$ / $\underline{0.15x^{101}}$ / $\underline{3t^2 - t^3}$

Not polynomials: 3^x | $|2b^3 - 6b|$ | $\frac{8}{5y^2}$ | $\frac{1}{2}$ $m^{\underline{0.75}} - m$

The **degree of a monomial** is the sum of the exponents of the variables.

Example 1: Identifying the Degree of a Monomial

Identify the degree of each monomial.

A. z^6

z^6 Identify the exponent.

The degree is 6.

B. 5.6

$5.6 = 5.6x^0$ Identify the exponent.

The degree is 0.

C. ~~$8xy^3$~~

$8x^1y^3$ Add the exponents.

The degree is 4.

D. a^2bc^3

$a^2b^1c^3$ Add the exponents.

The degree is 6.

5.6 (1)

$a^2(b)c^3$

$a^2b^1c^3$

A **degree of a polynomial** is given by the term with the greatest degree.

A polynomial with one variable is in standard form when its terms are written in descending order by degree.

So, in standard form, the degree of the first term indicates the degree of the polynomial, and the **leading coefficient** is the coefficient of the first term.

Standard Form

Leading coefficient Degree of polynomial

$5x^3 + 8x^2 + 3x - 17$

Degree of term: 3 2 1 0

The diagram shows the polynomial $5x^3 + 8x^2 + 3x - 17$ in standard form. The leading coefficient '5' is underlined in red, with a red arrow pointing to it from the label 'Leading coefficient'. The exponent '3' on the first term is circled in red, with a blue arrow pointing to it from the label 'Degree of polynomial'. Below the polynomial, the degrees of each term are listed: 3 for $5x^3$, 2 for $8x^2$, 1 for $3x$, and 0 for -17 . Small red marks are present above the exponents: a red dash above the 3, a red dash above the 2, a red dash above the 1, and a red 'x' above the 0.

A polynomial can be classified by its number of terms.

A polynomial with two terms is called a **binomial**, and a polynomial with three terms is called a **trinomial**.

A polynomial can also be classified by its degree.

Classifying Polynomials by Degree		
Name	Degree	Example
<u>Constant</u>	0	-9
<u>Linear</u>	1	$x - 4$
<u>Quadratic</u>	2	$x^2 + 3x - 1$
<u>Cubic</u>	3	$x^3 + 2x^2 + x + 1$
Quartic	4	$2x^4 + x^3 + 3x^2 + 4x - 1$
Quintic	5	$7x^5 + x^4 - x^3 + 3x^2 + 2x - 1$

Example 2: Classifying Polynomials

Rewrite each polynomial in standard form.
Then identify the leading coefficient, degree,
and number of terms. Name the polynomial.

A. $3 - 5x^2 + 4x$

Write terms in
descending order by
degree.

$$-5x^2 + 4x + 3$$

Leading coefficient: -5
Degree: 2
Terms: *trinomial*
Name: *quadratic*

B. $3x^2 - 4 + 8x^4$

Write terms in
descending order by
degree.

$$8x^4 + 3x^2 - 4$$

Leading coefficient: 8
Degree: 4
Terms: *trinomial*
Name: *quartic*

**Rewrite each polynomial in standard form.
Then identify the leading coefficient, degree,
and number of terms. Name the polynomial.**

a. $4x - 2x^2 + 2$

b. $-18x^2 + x^3 - 5 + 2x$

Write terms in
descending order by
degree.

$$\underbrace{-2x^{\textcircled{2}} + 4x + 2}$$

Leading coefficient: -2

Degree: 2

Terms: *trinomial*

Name: *quadratic*

Write terms in
descending order by
degree.

$$\boxed{x^{\textcircled{3}}} - 18x^2 + 2x - 5$$

Leading coefficient: 1

Degree: 3

Terms: *polynomial w/4 terms*

Name: *cubic*

Example 3: Adding and Subtracting Polynomials

Add or subtract. Write your answer in standard form.

A. $(2x^3 + 9 - x) + (5x^2 + 4 + 7x + x^3)$

Add vertically.

$$\begin{array}{cccc} \textcircled{2x^3} & \textcircled{+ 9} & \textcircled{-x} & \textcircled{+ 5x^2} \\ \textcircled{+ x^3} & \textcircled{+ 4} & \textcircled{+ 7x} & \hline \end{array}$$

$$3x^3 + 13 + 6x + 5x^2$$

$$= 3x^3 + 5x^2 + 6x + 13$$

Example 3: Adding and Subtracting Polynomials

Add or subtract. Write your answer in standard form.

B. $(3 - 2x^2) - (x^2 + 6 - x)$

distribute

Add the opposite horizontally.

$$\begin{array}{r} \cancel{3} - \cancel{2}x^2 - \cancel{x^2} - \cancel{6} + \underline{\underline{x}} \end{array} = \underbrace{-3 - 3x^2 + x}$$

↓

$$\boxed{-3x^2 + x - 3}$$

Add or subtract. Write your answer in standard form.

$$(-\underline{36x^2} + \boxed{6x} - 11) + (\underline{6x^2} + \cancel{16x^3} - 5)$$

$$= \cancel{16}x^3 - 30x^2 + 6x - 16$$

Add or subtract. Write your answer in standard form.

$$(5x^3 + \underline{12} + 6x^2) - (15x^2 + 3x - \underline{2})$$

$$5x^3 - 9x^2 - 3x + \cancel{10}$$

$$5x^3 - 9x^2 - 3x + 14$$
